

Condensation - the facts

Condensation is the most common yet easiest type of damp to manage. It occurs mainly during cold weather it forms when warm moisture in the air comes into contact with cold surfaces like windows, floors or walls. Condensation also occurs in places where there is poor air flow like corners of rooms and behind furniture.

Condensation is the most common cause of black mould which can spread easily when mould spores land on a surface upon which it can grow and multiply.

What daily activities contribute to the amount of condensation in our home?

One person in the house for 16 hours	8 pints
Drying clothes indoors	6 pints
Cooking and the use of a kettle	6 pints
A bath or shower	3 pints
Washing dishes	2 pints
